"Divergent evolution of membrane protein topology: the Escherich coli RnfA and RnfE homologues.";

"Divergent evolution of membrane complex;

-!- FUNCTION: May be part of a membrane complex involved in electransport (By similarity).

-!- SUBUNTION: May be part of a least six subunits; rnfA, rnfB, rnfC, rnfD, rnfE and rnfG (By similarity).

-!- SUBCELLULAR LOCATION: Integral membrane protein. Inner membr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This SWISS-PROT entry is copyright. Sci. U.S.A. 100:5455-5460(2003).
Digests double-stranded RNA. Involved in the processing nal RNA precursors and of some mRNAS (By similarity).
ACTIVITY: Endonucleolytic cleavage to 5'-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             AR LOCATION: Cytoplasmic.

Y: Contains 1 DRBM (double-stranded RNA-binding) domain.

Y: Contains 1 RNase III domain.
                                                                                                                                                                                                            Gaps

-!- PUNCTION: INVOLVED IN BIOSYNTHESIS OF A DEMOLYBDO COFACTOR (MOLYBDOPTERIN), MECESSARY FOR MOLYBDOBNZYMES. PLAYS A ROLE I ACTIVATION OF THE SMALL SUBUNIT OF THE MOLYBDOPTERIN CONVERTI FACTOR (MOLD) (BY SIMILARITY).
-!- PATHWAY: MOLYBDOPM COFACTOR biosynthesis.
-!- SIMILARITY: BELONGS TO THE HESA/MOEB/THIF FAMILY.

Rieder M.J., Livingston R.J., Daniels M.R., Montoya M.A., Chung Rieder M.J., Livingston R.J., Daniels M.R., Montoya M.A., Chung Miyamoto K.E., Nguyen C.P., Nguyen D.A., Pool C.L., Robertson P. Schackwitz W.S., Sherwood J.K., Witrak L.A., Nickerson D.A.; Submitted (JAN-2003) to the EMBL/GenBank/DDBJ databases.

-!- FUNCTION: Cytokine that binds to LTBK/TRERSF3. May play a sprola in immune response regulation. Provides the membrane and for the attachment of the heterotrimeric complex to the cell surface. Isoform 2 is probably non-functional.

-!- SUBUNIT: Heterotrimer of either two LTB and one LTA subunits (less prevalent) one LTB and two LTA subunits.

-!- SUBCELLULAR LOCATION: Type II membrane protein (Potential).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 This SWISS-PROT entry is copyright. -!- FUNCTION: Functions in the N-end rule pathway of protein degradation where it conjugates Leu, Phe and, less efficientl. Met from aminoacyl-RRMs to the N-termini of proteins contain an N-terminal arginine or lysine (By similarity).

-!- CATALYTIC ACTIVITY: L-leucyl-tRNA + protein = tRNA + L-leucyl
                                                                                                                                                                                                                                                                                          coprotein, Signal-anchor.

Rhabditidae, Peloderinae, Caenorhabditis.
lipoamide dehydrogenase (E3).
-!- FUNCTION: THE B.SUBTILIS PDH COMPLEX POSSESSES ALSO BRANCHED-
2-OXOACID DEHYDROGENASE (BCDH) ACTIVITY.
-!- CATALYTIC ACTIVITY: Pyruvate + lipoamide = S-
acetyldihydrolipoamide + CD(2).
-!- COFACTOR: Thiamine pyrophosphate.
-!- SUBUNIT: Heterodimer of an alpha and a beta chain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Jassal B.;
Submitted (JAN-1995) to the EMBL/GenBank/DDBJ databases.
-!- SUBCELLULAR LOCATION: Integral membrane protein (Potential)
-!- SIMILARITY: BELONGS TO THE C.ELEGANS RECEPTOR-LIKE PROTEIN.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   2.5%; Score 7; DB 1; Length 324; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            J. Biochem. 109:852-857(1991).
-!- FUNCTION: Catalyzes the oxidation of 3-carboxy-2-hydroxy-4-methylpentanoate (3-isopropylmalate) to 3-carboxy-4-methyl-2-oxopentanoate. The product decarboxylates to 4-methyl-2-oxopentanoate.
                                                                                                                                                                                                                                                                                      Bacteria; Deinococcus-Thermus; Deinococci; Thermales; Thermaceae;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         oxopentanoate. CATALYTIC ACTIVITY: 3-carboxy-2-hydroxy-4-methylpentanoate +
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Kirino H., Oshima T.;
"Molecular cloning and nucleotide sequence of 3-isopropylmalate
dehydrogenase gene (leuB) from an extreme thermophile, Thermus

Purification of rabbit and human serum paraoxonase.";

Biochemistry 30:10133-10140(1991).

-!- FUNCTION: Hydrolyzes the toxic metabolites of a variety of organophosphora insecticides. Capable of hydrolyzing a broad spectrum of organophosphate substrates and a number of aromat: carboxylic acid esters. Mediates an enzymatic protection of 1c density lipoproteins against oxidative modification.

-!- CATALYTIC ACTIVITY: Aryl dialkyl phosphate + H(2)O = dialkyl phosphate + an aryl alcohol.

-!- CHALVITC ACTIVITY: A phenyl acetate + H(2)O = a phenol + acet

-!- SUBCELLULAR LOCATION: Extracellular.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   PTM: Glycosylated.

PTM: The signal sequence is not cleaved.

PTM: The signal sequence is not cleaved.

POLYMORPHISM: There are two allelic forms, allozyme A and B, v differ in their embstrate specificity. Both forms have similar arylesterage activity but allozyme B possesses greater paraox activity. Allozyme A is better at protecting LDL from oxidatic SIMILARITY: Belongs to the paraoxonase family.

CAUTION: Ref. 3 (ARC6398) sequence differs from that shown due a stop codon in position 355.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SEQUENCE FROM N.A., FUNCTION, AND VARIANTS SER-81; GLU-92 AND GLY.

Ly Biol. Chem. 272:4201-4211(1997).

Ly Biol. Chem. Subtities electrons from NADH, via FMN and irc sulfur (Re-S) centers, to quinones in the respiratory chain. Immediate electron acceptor for the enzyme in this species is believed to be menaquinone. Couples the redox reaction to protor translocation (for every two electrons transferred, four hydrons are translocated across the cytoplasmic membrane), and to conserves the redox energy in a proton gradient.

-!- CATALYTIC ACTIVITY: NADHH + quinone = NAD(+) + quinol.

-!- SUBUNIT: COMPOSED OF 14 DIFFERENT SUBUNITS. SUBUNITS NGO7-14

CONSTITUTE THE MEMBRANE SECTOR OF THE COMPLEX.

-!- SUBMITY: Belongs to the complex I submit 1 family.

Both activities result in ge of the full-length protein and covalent attachment of rol moiety to the C-terminal of the newly generated N-ragment (N-product). This covalent modification appears essential role in restricting the spatial distribution

AR LOCATION: THE C-TERMINAL PEPTIDE DIFFUSES FROM THE TERMINAL PEPTIDE BERMAINS ASSOCIATED WITH THE ACE. HEIGHEN PROPRIED IN EITHER CLEAVED WED FORM TO MEDIATE SIGNALING TO OTHER CHILS (BY
                                                                                                                                                                                                                                                                                                                                                                                    C-terminal domain displays an autoproteolysis activity lesterol transferase activity. Both activities result in age of the full-length protein and covalent attachment of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            erol moiety to the C-terminal of the newly generated N-fragment (N-product). This covalent modification appears un essential role in restricting the spatial distribution otein activity to the cell surface. The N-product is the ceins in both local and long-range signaling, whereas the has no signaling activity (By similarity).

Y: Belongs to the hedgehog family.

-!- TISSUE SPECIFICITY: Oocytes.
-!- DEVELOPMENTAL STAGE: Expressed during the 2-week growth phase oogenesis, prior to ovulation.
-!- PTM: Sulfated glycoprotein with 0-linked oligosaccharides.
-!- PTM: Sulfated glycoprotein with 0-linked oligosaccharides.
-!- SIMILARITY: Contains 1 ZP domain.
                                                                                                                                                                                                                                                                                      This SWISS-PROT entry is copyright.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ss sperm receptor activity."; Full 1992).
Functions as a sperm-receptor. It is responsible for lession to the zona pellucida, and may contribute to the specificity of the insemination.
ZP3 FORMS WITH ZP1 AND ZP2 THE ZONA PELLUCIDA, IN AND ZP3 COMPLEX INTO COPOLYMERS CROSS-LINKED BY ZP1.

This enzyme catalyzes the light-dependent monomerization lM) of cyclobuty1 pyrimidine dimers (in cis-syn ion), which are formed between adjacent bases on the strand, upon exposure to ultraviolet radiation.
ACTIVITY: Cyclobutadipyrimidine (in DNA) = 2 pyrimidine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Contains 2 chromophores: a reduced flavin (FADH2) and an 3-hydroxy-5-deazaflavin (F420). Both chromophores are
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2), At TRNA LIGASE II; 1.
synthetase, Protein biosynthesis; Ligase; ATP-binding;
                                                                                                                                                       Belongs to class-II aminoacyl-tRNA synthetase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ion-covalent interactions.
SOUS: THIS PROTEIN BELONGS TO THE "LONG WAVELENGTH-TYPE
IS" WITH AN ABSORPTION MAXIMUM AT ABOUT 440 NM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
